1)

2) a) Waterfall Model : It is very simple and to understand and use. In waterfall model , each developing path mus be finished before the next path can be began. If company could develop part to part of project. Programmer wouldn't get back to project that can be processed steadily.

b)Incremental Model : It produces some difference model for representing to client .

Firstly, a reduced version of the final product base is developed. New features are added incrementally until this version is tested and evaluated by the last user until the system is finished.

c)Iterative Model : It is model that allows the software company to find and resolve mistakes early in the software developed cycle. So, Development process will be more effective. The cycle is divided many part. Process is done on small parts. With this model , when the first iteration is completed and a simple product of software is obtained.
